CHAPTER 1

1. INTRODUCTION

1.1 Rationale

The Integrated Inventory & Online Shop System for Efficient Stock Control and Order Processing (Scentora) was born out of the day-to-day experiences of small business owners. One of the biggest inspirations for the project was likely our classmate's aunt, who had just opened a smaller business. With 2-3 employees, she was finding it time-consuming to have to physically count inventory, often complaining about how tiring it was to keep up with products. This is a reality for small business owners, especially as they expand. With this, the emergence of e-commerce brought a distinct challenge. We saw that with a system that incorporates both inventory management and an online storefront, we could not only alleviate the operational strain but also expand the business's exposure past local consumers to the world.

As companies expand, manual operation becomes more and more challenging. A particular instance we observed was a local sporting goods stand close to my home. The middle-aged owner of the shop constantly complained about the back-and-forth motion of restocking and counting inventory, mentioning the fatigue that accompanies manual operation. His frustration was reminiscent of the problem most small companies have in regards to outdated inventory management systems. Even though he is not our client, his situation hints at a larger gap in the marketplace for an effective inventory system. We think that automating the process would minimize physical stress, save time, and enable companies to make better decisions, ultimately optimizing their bottom line.

For the stock management system, Scentora streamlines the process, making it so much quicker to monitor stock levels and renew products. Rather than taking hours to manually check stock, staff can view real-time updates at the touch of a button. For online shopping, we believe there is a genuine advantage for the consumer who is fed up with driving to physical stores only to discover the

item is out of stock. With the convenience of online shopping, customers can easily view what is on offer, place an order, and even have products delivered to their front door saving them time and effort. The added advantage of increasing the reach of the business, beyond the local customer, means this system is the perfect solution for businesses looking to expand.

1.2 Objectives

1.2.1 General Objectives

To improve the operational efficiency of the business by developing an integrated system that manages inventory and orders through both an online platform and an efficient inventory management system. This will streamline business operations, reduce manual work, and ensure better accuracy in tracking stock and fulfilling orders. To expand the business's market reach by introducing an e-commerce system that allows customers to place orders from anywhere, ensuring a broader customer base beyond local markets and increasing the business's visibility.

1.2.3 Specific Objectives

1. Enhance the efficiency of inventory management by eliminating manual updates and low-stock alerts, enhancing the process by 10-15%.
2. Improve the speed of order fulfillment by automating the processing of orders, resulting in quicker delivery and increased precision in order fulfillment.
3. Enhance customer satisfaction by optimizing the online shopping experience, with the goal of minimizing checkout time and enhancing product availability updates.

4. Increase market coverage through the launch of an e-commerce portal where customers outside the immediate market area can order products.
5. Offer a convenient shopping experience to customers through browsing available products, real-time stock checking, and effortless ordering from anywhere.
6. Provide safe, online payment methods such as GCash and online banking payments via QR code for seamless and effortless transaction processing.
7. Enable customers to monitor their payments and order status to enhance transparency and credibility.

1.3 Scope and Limitation

1.3.1 Scope

The system will serve as an integrated solution that provides both inventory management and e-commerce functionalities. It will allow business owners to manage product listings, stock quantities, and low stock level notices in real-time, reducing manual stock counts. The e-commerce site will allow customers to browse products, order, and pay online and see real-time details of their order and payment status, which enhances transparency and trust.

This solution will be seamlessly integrated into the current infrastructure of the business to guarantee minimal downtime. The system will have an easy-to-use user interface that is fitting for business owners and customers. Payment processing will be handled through digital methods, like GCash and online banking through QR codes, for the convenience and security of the customers.

The scope of the first release will be limited to core functionality such as

replenishment of orders and web ordering. Future releases can include features such as detailed analytics for monitoring sales patterns, inventory activity, and customer actions. Future releases can also include distributor management features to enable suppliers to control product inventory directly within the system, further enhancing efficiency.

1.3.2 Limitation

The first release of the system will include primarily the core inventory management and e-commerce capabilities. Multi-channel selling and advanced reporting capabilities are not included in the initial release. The inventory management system will be accessible to business managers and owners only, and distributors are not included in this release. The user interface will be functional but simple with future releases to refine the user interface

There may be challenges in the initial release related to network reliability and device compatibility, which could affect the smooth operation of the system. As the business transitions to a digital system, limited resources, such as budget constraints and availability of staff for training and implementation, may affect the scope of features in the first release. These constraints could delay the introduction of advanced functionalities or enhancements in the system.

Additionally, user acceptance would be an issue as the employees and the customers would need to adapt to the new system. The learning process would temporarily affect business operations as the users familiarize themselves with the digital platform. Data privacy issues with the customer data will need to be addressed with utmost caution to ensure compliance with local regulations. Finally, stakeholder acceptance most importantly, from the customers and, maybe, the distributors as well will be vital, and willingness on the part of the stakeholders to embrace the system will decide the adoption rate. .

CHAPTER 2

ANALYSIS AND DESIGN

2.1 Business Process

This flowchart illustrates the simplified process of order submission and inventory management. The customer begins with online store browsing, selecting the items he desires. Upon selecting, the customer proceeds to the checkout page where he chooses his mode of payment (e.g., GCash or online banking via QR code). Payment made, the system will update the status of the order upon successful payment processing.

The levels of inventory are automatically adjusted in real time by the system according to items purchased. The business owner is notified of the new order and revised stock levels, allowing for efficient management of inventory. The customer is notified of his or her order and payment status, offering transparent and seamless service. This efficient process allows for effective order and inventory control with little manual effort and greater business efficiency overall.

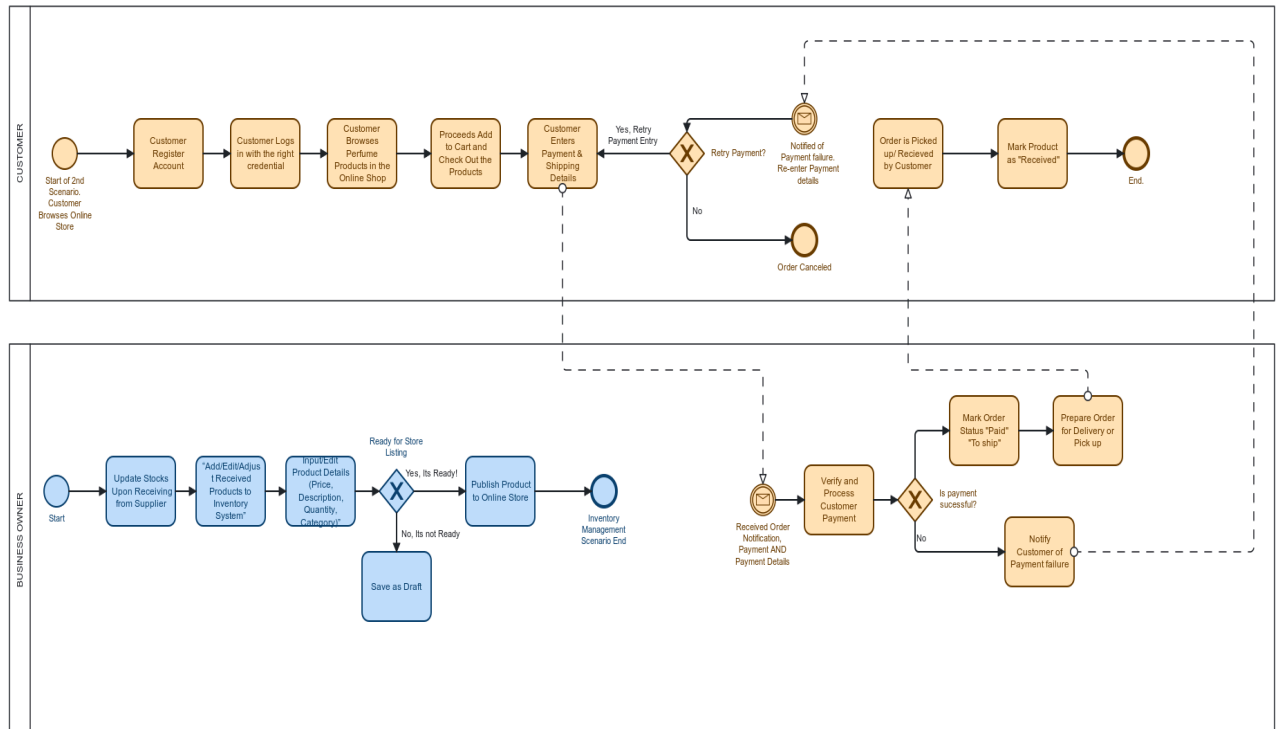

Figure 2.1: Figure of Business Process Flowchart

2.2 Users

The Integrated Inventory & Online Shop System caters to several user classes, each with distinct roles and responsibilities. The system is designed to be accessible and user-friendly, ensuring that both tech-savvy and less-experienced users can navigate it effectively.

1. Customers

The customers are the actual users of the e-commerce system. They utilize the system to browse the product listings, select products to cart, make orders, and safely pay. Since the target customer group is predominantly technology literate, the system is designed to be user-friendly with simple navigation, quick access to product information, and few steps for checking out.

Customers will even have the option of checking their payment status and order status in real-time, making it transparent and a hassle-free shopping experience.

2. Business Owners/Managers

Business owners or managers will be responsible for overseeing the day-to-day operation of the system. Not being technologically advanced as experts, they are used to simple systems and procedures. They interact with the system for inventory management by inserting new products, updating product data, and monitoring stock levels. Automatic notifications are generated when stock levels run low to help them keep track of inventory in real-time. The system interface is extremely straightforward and easy to use, and the business owner can easily manage orders, payments, and product listings without needing advanced technical knowledge.

3. System Administrator

The business owner himself, or herself in most cases, will act as the system administrator with full control and access to the back end of the system. The administrator will be responsible for managing user accounts, ensuring system security, and overall operation. He/she will be capable of managing all system parameters, monitoring inventory updates, monitoring the progress of orders, and resolving any issues that may arise. Since the system administrator and the business owner are the same person, they will ensure that the platform is stable, and they will attend to all issues of the online presence of the business and inventory management.

4. Support Staff

Support staff use the system to assist customers with queries, solve issues pertaining to orders, address customer satisfaction issues. They have limited access to the system and work on customer support matters.

2.3 ERD

Entity-Relationship Diagram (ERD) for "Integrated Inventory & Online Shop System for Basic Stock Control and Order Processing"

This Entity-Relationship Diagram (ERD) visualizes the database structure for the Integrated Inventory & Online Shop System designed to streamline inventory management and order processing for small and medium-sized enterprises (SMEs). The ERD represents key entities and their relationships, ensuring efficient data flow and database integrity.

- **User:** Represents the different types of users within the system, which include Admin and Consumer. Each user can have one unique profile, including personal details like name, email, and address.
- **Cart:** A cart is associated with a User, where products are added before the user proceeds to checkout. The system allows only one cart per user, and each cart contains multiple products, represented by their Product_ID and Quantity.
- **Product:** This entity contains the details about each product in the inventory, such as Product_Name, Product_Price, Stock_Level, and Category. Products are linked to orders through the OrderDetails entity.
- **Order:** The Order entity holds the details of customer purchases, such as Order_ID, Total_Amount, and Shipping_Address. Each Order is placed by a User (Consumer), and each order can contain one or more products linked through the OrderDetails entity.
- **OrderDetails:** This junction table connects Order and Product, tracking the quantity and subtotal for each item in the order. It also provides a detailed breakdown of each product in an order.
- **AdminDetails & ConsumerDetails:** These entities hold additional information specific to Admin and Consumer users. AdminDetails includes inventory-related data, while ConsumerDetails stores information such as the consumer's address.

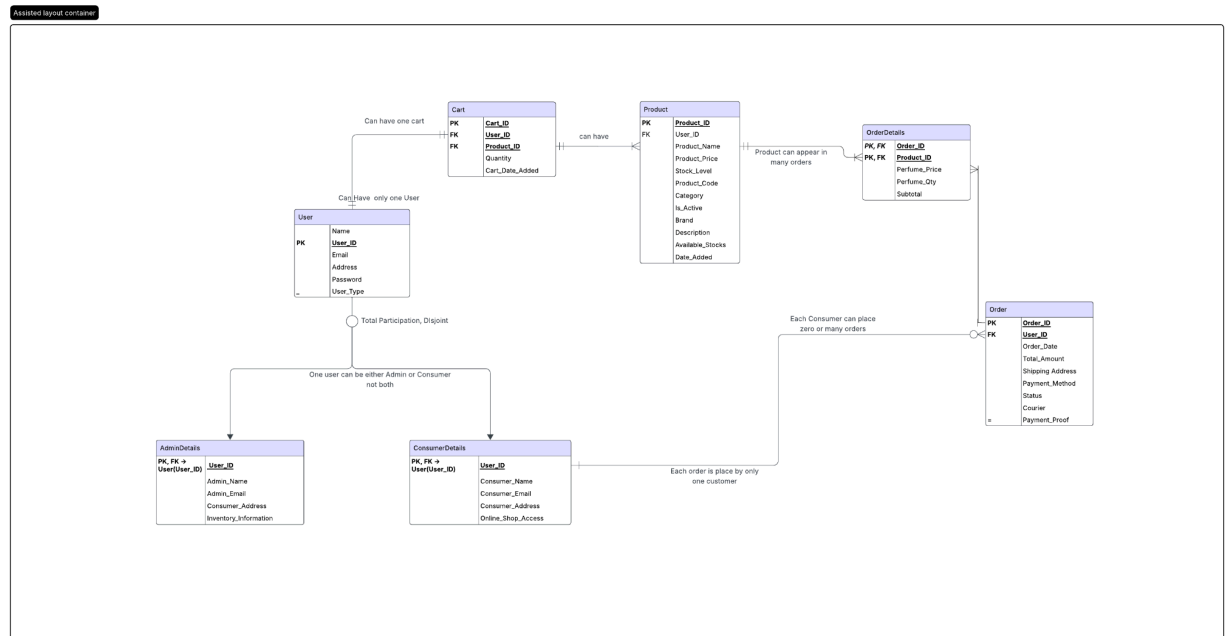

Figure 2.31 Entity Relationship Diagram

2.4 SQL Queries Used

SQL Query 1: List all customers' information

Purpose:

This query retrieves basic information about all users, including their name, email, address, and user type (e.g., Admin, Consumer, Employee).

```
SELECT User_ID, Name, Email, Address, User_Type, Profile_Image
FROM user;
```

User_ID	Name	Email	Address	User_Type	Profile_Image
1	AdminUser	admin@example.com	Cebu City	Admin	NULL
2	ConsumerUser	customer@example.com	Cebu City	Consumer	NULL
3	EmployeeUser	employee@gmail.com	Lapu-Lapu City	Employee	NULL
4	dave lang	dave@test.com		Consumer	NULL
5	Dave Lagunda	davelagunda@gmail.com		Consumer	NULL
6	Kylle A. Buhia	kylle@gmail.com	-USC - TC	Consumer	../uploads/profile/Halo (1).png
7	Kylle Andrei	kyllebuhia@gmail.com		Consumer	../uploads/profile/card_qr.jpg

Figure 2.4.1 Customer Information Sample Data

SQL Query 2: List all active products

Purpose:

This query retrieves all active products available in the store, showing their details like name, price, and available stock.

SELECT Product_ID, Product_Name, Product_Price, Available_Stocks
FROM product
WHERE Is_Active = 1;

Extra options

←T→	Product_ID	Product_Name	Product_Price	Available_Stocks
☐  Edit  Copy  Delete	2	La Parfum	1000.00	450
☐  Edit  Copy  Delete	3	Velvet Haze	15000.00	1
☐  Edit  Copy  Delete	4	Midnight Whisper	5000.00	54
☐  Edit  Copy  Delete	5	Golden Dew	500.00	435
☐  Edit  Copy  Delete	6	Luminous Veil	3500.00	65

Figure 2.4.2 Active Products Sample Data

SQL Query 3: Get all products in a specific category

Purpose:

This query retrieves all products belonging to a specific category, in this case, "Floral".

SELECT Product_ID, Product_Name, Product_Price
FROM product

WHERE Category = 'Floral';

		Product_ID	Product_Name	Product_Price
☐	 Edit	 Copy	 Delete	
		2	La Parfum	1000.00
☐	 Edit	 Copy	 Delete	
		3	Velvet Haze	15000.00
☐	 Edit	 Copy	 Delete	
		4	Midnight Whisper	5000.00
☐	 Edit	 Copy	 Delete	
		5	Golden Dew	500.00

Figure 2.3.3 Filter Product Category Sample Data

SQL Query 4: Find low stock products

Purpose:

This query identifies all products with low stock, with stock levels below 25

SELECT Product_Name,

FROM product

WHERE Available_Stocks < 25;

		Product_Name	Available_Stocks
☐	 Edit	 Copy	 Delete
		Velvet Haze	1

Figure 2.3.4 Low Stock Products Sample Data

SQL Query 5: List all orders for a specific customer

Purpose:

This query lists all the orders placed by a specific customer, identified by their User_Id

SELECT o.Order_ID, o.Order_Date, o.Total_Amount, o.Status

FROM order o

WHERE o.User_ID = 5;

		Order_ID	Order_Date	Total_Amount	Status
☐	Edit Copy Delete	1	2025-07-15 10:14:51	59.00	Pending
☐	Edit Copy Delete	3	2025-07-15 10:33:23	1.00	Pending
☐	Edit Copy Delete	4	2025-07-15 10:38:55	2.00	Pending
☐	Edit Copy Delete	5	2025-07-15 10:46:35	1.00	Pending

Figure 2.3.5 Specific Customer Order Sample Data

SQL Query 6: Retrieve details of a specific order

Purpose:

This query fetches the details of a specific order, including product information, for a given Order_ID.

```
SELECT od.Order_ID, p.Product_Name, od.Product_Price, od.Product_Qty  
FROM orderdetails od  
JOIN product p ON od.Product_ID = p.Product_ID  
WHERE od.Order_ID = 1;
```

Order_ID	Product_Name	Product_Price	Product_Qty
1	La Parfum	1.00	5
1	Velvet Haze	21.00	2
1	Midnight Whisper	12.00	1

Figure 2.3.6 Specific Order Details Sample Data

SQL Query 7: Find all orders with products and their subtotal

Purpose:

This query retrieves all orders along with the products in each order, showing the quantity, price, and subtotal for each product in the order.

```
SELECT o.Order_ID, p.Product_Name, od.Product_Qty, od.Product_Price,  
      (od.Product_Qty * od.Product_Price) AS Subtotal  
FROM orderdetails od  
JOIN product p ON od.Product_ID = p.Product_ID  
JOIN `order` o ON od.Order_ID = o.Order_ID;
```

Order_ID	Product_Name	Product_Qty	Product_Price	Subtotal
2	La Parfum	1	1.00	1.00
7	La Parfum	4	1.00	4.00
1	La Parfum	5	1.00	5.00
3	La Parfum	1	1.00	1.00
4	La Parfum	2	1.00	2.00
5	La Parfum	1	1.00	1.00
1	Velvet Haze	2	21.00	42.00
1	Midnight Whisper	1	12.00	12.00
6	Golden Dew	1	69.00	69.00
6	Luminous Veil	1	100.00	100.00

2.5 Functional Requirements

Table 2.5.1 shows the functional requirements for the customer interface.

Table 2.5.1: Customer Interface Functional Requirements

RequirementNo.	Description	Priority
REQ 0001	The customer should be able to browse available products in the online store.	Required
REQ 0002	The customer should be able to filter products by price range and category.	Required
REQ 0003	The customer should be able to add products to their cart	Required
REQ 0004	The customer should be able to view their cart with product details (name, price, quantity).	Required
REQ 0005	The customer should be able to update the quantity or remove items from the cart.	Required
REQ 0006	The customer should be able to proceed to checkout to complete the order.	Required

REQ 0007	The customer should be able to choose a payment method (e.g., Gcash, Credit/Debit QR code)	Required
REQ 0008	The customer should be able to track their order status and payment status in real-time.	Required

Table 2.5.2 shows the functional requirements for the business owner interface.

Table 2.5.2: Business Owner/Manager Interface Functional Requirements

RequirementNo.	Description	Priority
REQ 0009	The business owner should be able to add, edit, or remove products from the inventory.	Required
REQ 0010	The business owner should be able to update product price and stock levels	Required
REQ 0011	The business owner should receive low stock notifications for products.	Required
REQ 0012	The business owner should be able to manage order cancellations if the order hasn't been paid yet.	Required
REQ 0013	The business owner should be able to view order history and order details	Required
REQ 0014	The business owner should be able to manage user accounts (create, deactivate, or modify roles).	Required
REQ 0015	The business owner should have access to view and edit system settings.	Required
REQ 0016	The business owner should be able to generate inventory reports and sales data.	Required
REQ 0017	The business owner should monitor order progress and handle issues related to payments or deliveries.	Required

Table 2.5.3 shows the functional requirements for the Payment and Checkout.

Table 2.5.3: Payment and Checkout Functional Requirements

RequirementNo.	Description	Priority
REQ 0018	The system should allow customers to choose from available payment methods (full payment through QR code).	Required
REQ 0019	The system should ensure secure payment processing through integration with payment gateways.	Required
REQ 0020	The system should update the order status to "Paid" after successful payment.	Required
REQ 0021	The business owner should be able to manage order cancellations if the order hasn't been paid yet.	Required

Table 2.4 shows the functional requirements for the Inventory Management.

Table 2.5.4: Inventory Management Functional Requirements

RequirementNo.	Description	Priority
REQ 0022	The system should allow the business owner to track inventory in real-time.	Required
REQ 0023	The system should allow for automatic updates to stock levels when orders are placed.	Required
REQ 0024	The system should notify the business owner when stock levels fall below a defined threshold.	Required
REQ 0025	The system should allow the business owner to view inventory reports (e.g., stock levels, best-selling products).	Required

Table 2.5.5 shows the functional requirements for Login and Password.

Table 2.5.5: Login and Password Management Functional Requirements

RequirementNo.	Description	Priority
----------------	-------------	----------

REQ 0026	The system should have a login page where users can log in using their email and password.	Required
REQ 0027	The system should allow users to reset their password via a link sent to their registered email.	Required
REQ 0028	The system should provide a password reset mechanism, including a reset token and expiration date.	Required
REQ 0029	The system should validate the reset token and allow users to update their password.	Required
REQ 0030	The system should hash passwords before storing them for security purposes.	Required
REQ 0031	The system should notify the user via email upon successful password reset.	Required

2.6 Access and Security Controls

User Roles

The present section establishes the user roles of the Integrated Inventory and Online Shop System for Basic Stock Management and Order Processing and states the access restrictions with respect to those roles, thus ensuring that users can make any actions only within the assigned permissions.

- **Admin / Business Owner:**

Admin or Business Owner is the system backbone, having complete control over user, order, and inventory management. They make the significant business decisions, maintain the system in proper order, and

ensure the customers are kept happy. They carry out day-to-day tasks such as managing stock, shipping orders, and modifying product prices. They also maintain control over the system configuration and performance monitoring, making them a pillar of the business's overall success.

- **Customer**

The Customer is in the center of the e-commerce website. They wish to browse, order, and pay for products. They are able to see only their own data and order history, so that they have a secure, personalized buying experience. They are able to use the site by browsing products, manage their shopping cart, and pay, but they are not able to see or modify the inventory or see other individuals' data.

- **Future Considerations**

As the system grows, the other roles like Support Staff and Admin Assistants can be introduced. These users can be assigned more limited permissions, for example, customer support or inventory support. The role-based access control (RBAC) can be introduced later for more granular control on who does what within the system.

Access Controls

While role-based access control (RBAC) has not been fully implemented in the system yet, roles are defined in the user table using the User_Type field. This allows us to classify users as Admin/Business Owner, Customer, or potentially future roles like Support Staff.

In future updates, RBAC will be fully implemented, and access control will be more granular. This will allow for more flexible management of user permissions based on roles, where each user type will have specific access to different parts of the system.

Security Considerations

- **Password Management:**

Passwords are hashed before being stored in the database. This ensures that user passwords are never stored in plaintext, improving security. Password hashing is implemented for secure storage of user credentials.

- **Session Management**

The system uses secure session management via tokens or cookies, ensuring that only authorized users can access their accounts and perform actions. This helps in preventing unauthorized access to the user's data during interactions with the system.

2.7 Project Schedule

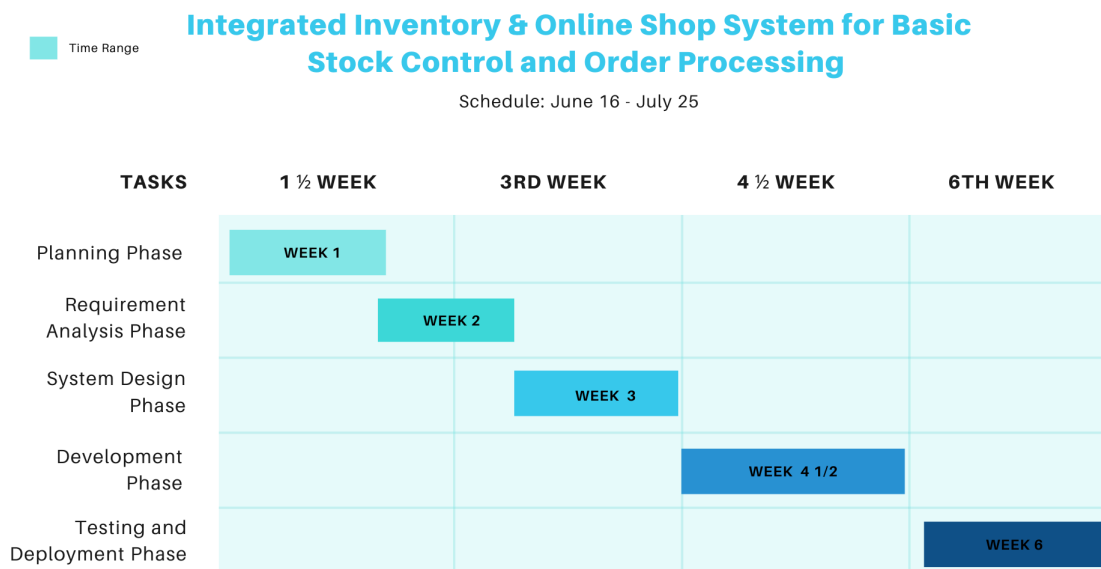

Project Schedule for "Integrated Inventory & Online Shop System for Basic Stock Control and Order Processing"

This project schedule outlines the timeline for the development and deployment of the "Integrated Inventory & Online Shop System" aimed at improving inventory management and order processing for small and medium-sized enterprises (SMEs). The schedule spans from June 16 to July 25, covering six weeks of detailed planning, development, testing, and deployment phases. Each phase is designed to ensure the system is efficient, user-friendly, and well-integrated with e-commerce features.

- Week 1: The Planning Phase involves initial setup, including identifying project goals, stakeholders, and resources.
- Week 2: The Requirement Analysis Phase focuses on understanding the detailed requirements of the system, including business needs, technical specifications, and user expectations.
- Week 3: The System Design Phase kicks off with designing the system architecture, database structure, and overall user experience, ensuring the system meets the outlined requirements.
- Week 4 ½: The Development Phase begins, where the actual system coding, user interface design, and system features are implemented.

- Week 6: The Testing and Deployment Phase ensures the system is fully functional, with thorough testing for bugs and performance issues. It concludes with the deployment of the system for use by the business.

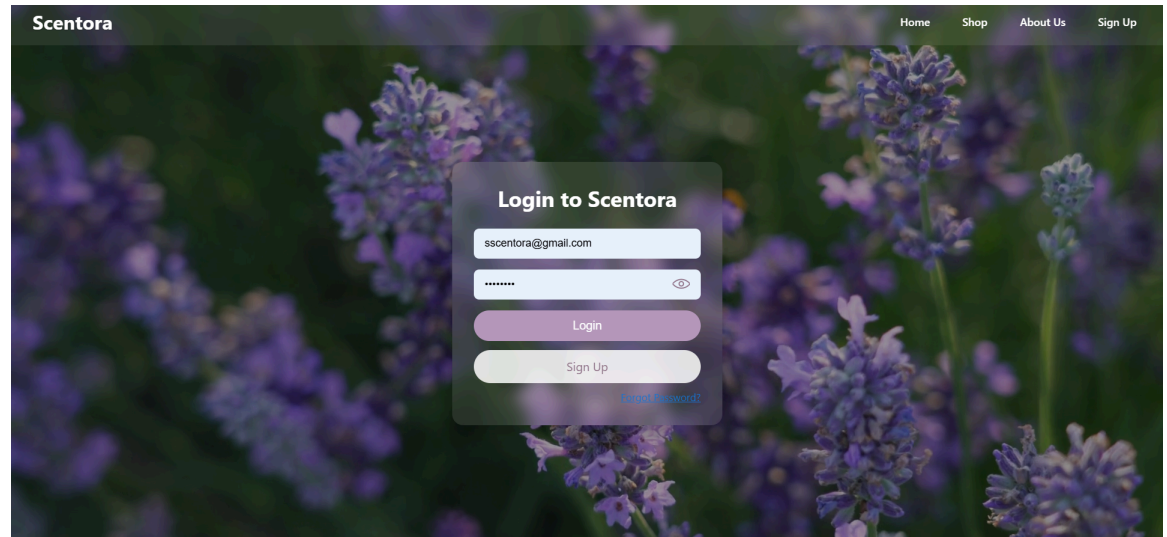

This schedule provides a clear overview of the necessary phases, helping ensure the project stays on track for completion by July 25.

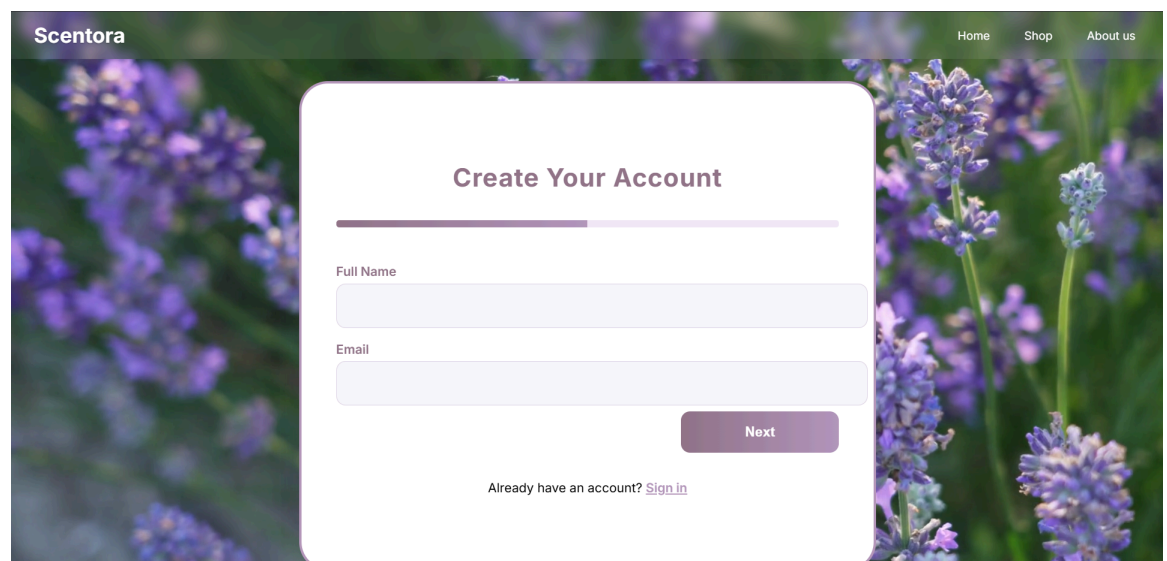

2.8 User Interface

<screenshots with descriptions>

1. **Login Page:** Allows users to log in to their account to access the platform.

2. **Sign Up:** Enables new users to create an account.

The screenshot shows the 'Create Your Account' form on the Scentora website. The form is centered on a page with a lavender background. It includes a title 'Create Your Account', a 'Password' field with a toggle icon, a 'Confirm Password' field with a toggle icon, and two buttons: 'Back' and 'Register'. Below the buttons is a link: 'Already have an account? [Sign in](#)'.

4. **Reset Password Email:** Sends a password reset link to the user's registered email.

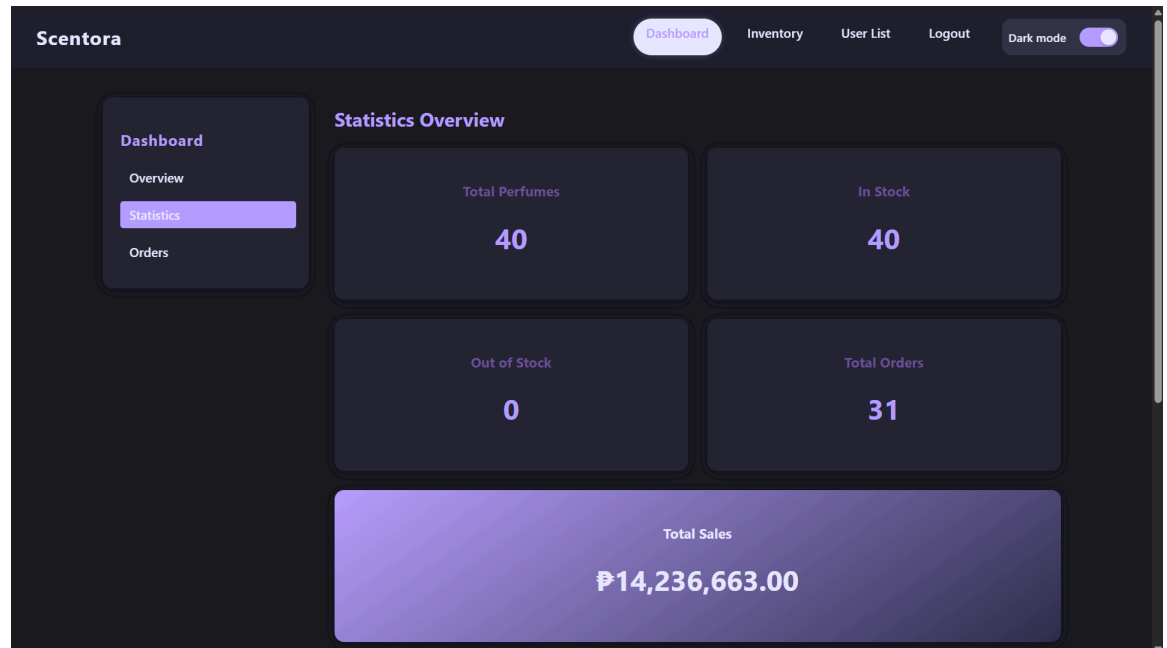

5. **Reset Password Page:** Allows users to create a new password after receiving the reset link.

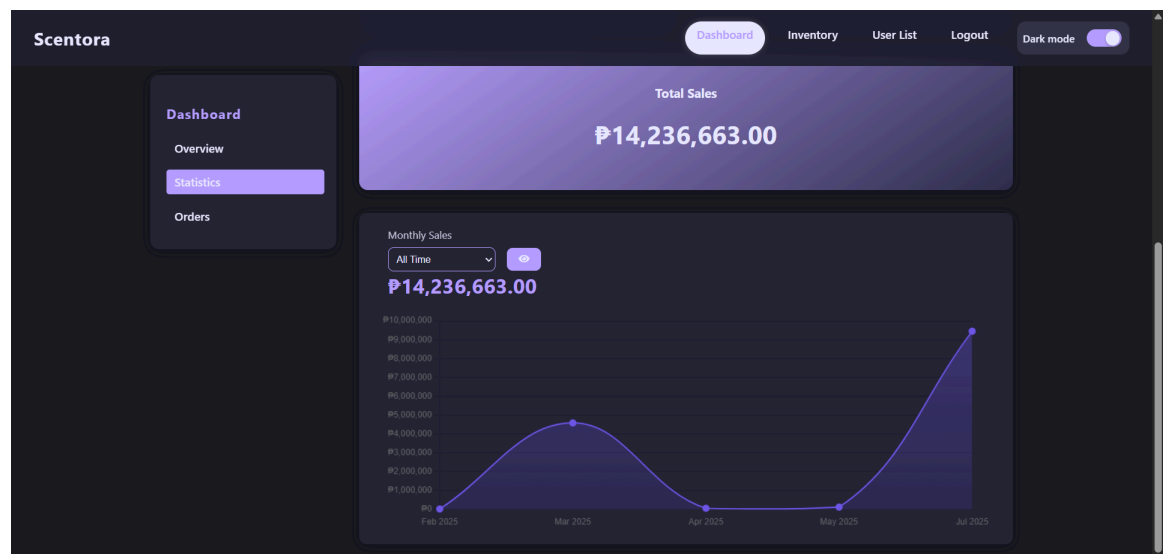

6. **Dashboard Page (Admin):** The admin interface to manage and view key business data.

7. **Statistic Page:** Displays total sales and order details for the current month.

8. **Total Sales:** Shows the overall sales figure for a specific time period.

9. **Total Order Detail for the Month:** Provides a breakdown of orders placed during the month.

This screenshot shows the first page of a modal titled "All Time Sales Details". At the top, there are three summary cards: "Total Sales" with a value of ₱14,236,663.00, "Orders" with a value of 20, and "Average Order" with a value of ₱711,833.15. Below these is a table of sales records. The table has four columns: Order ID, Product Name, Quantity, and Total Price. The first three rows show order #41 from 2025-07-08 09:45:00 for "Aventus Amazon Corporate", "Oud Wood Amazon Corporate", and "Tobacco Vanille Amazon Corporate" respectively, all with a total price of ₱1,950,000.00. The next two rows show order #39 from 2025-07-03 11:15:00 for "Aventus Amazon Corporate" and "Oud Wood Amazon Corporate", both with a total price of ₱3,200,000.00. At the bottom, it says "Page 1 of 4" with a "Next" button.

All Time Sales Details			
Total Sales	Orders	Average Order	
₱14,236,663.00	20	₱711,833.15	
#41 2025-07-08 09:45:00	Aventus Amazon Corporate	Qty: 97	₱1,950,000.00
#41 2025-07-08 09:45:00	Oud Wood Amazon Corporate	Qty: 102	₱1,950,000.00
#41 2025-07-08 09:45:00	Tobacco Vanille Amazon Corporate	Qty: 108	₱1,950,000.00
#39 2025-07-03 11:15:00	Aventus Amazon Corporate	Qty: 160	₱3,200,000.00
#39 2025-07-03 11:15:00	Oud Wood Amazon Corporate	Qty: 168	₱3,200,000.00

Page 1 of 4 [Next](#)

This screenshot shows the second page of the "All Time Sales Details" modal. It features the same summary cards as the first page. The table continues with five more rows: order #39 from 2025-07-03 11:15:00 for "Tobacco Vanille Amazon Corporate" (Qty: 177, ₱3,200,000.00), order #38 from 2025-07-02 10:30:00 for "Aventus Amazon Corporate" (Qty: 90, ₱1,800,000.00), order #38 from 2025-07-02 10:30:00 for "Oud Wood Amazon Corporate" (Qty: 94, ₱1,800,000.00), order #38 from 2025-07-02 10:30:00 for "Tobacco Vanille Amazon Corporate" (Qty: 100, ₱1,800,000.00), and order #37 from 2025-07-01 09:00:00 for "Aventus Amazon Corporate" (Qty: 125, ₱2,500,000.00). At the bottom, it says "Page 2 of 4" with "Previous" and "Next" buttons.

All Time Sales Details			
Total Sales	Orders	Average Order	
₱14,236,663.00	20	₱711,833.15	
#39 2025-07-03 11:15:00	Tobacco Vanille Amazon Corporate	Qty: 177	₱3,200,000.00
#38 2025-07-02 10:30:00	Aventus Amazon Corporate	Qty: 90	₱1,800,000.00
#38 2025-07-02 10:30:00	Oud Wood Amazon Corporate	Qty: 94	₱1,800,000.00
#38 2025-07-02 10:30:00	Tobacco Vanille Amazon Corporate	Qty: 100	₱1,800,000.00
#37 2025-07-01 09:00:00	Aventus Amazon Corporate	Qty: 125	₱2,500,000.00

11. **Inventory Page:** Enables admins to manage inventory items by adding or editing products.

12. **User List Page:** Displays a list of registered users and their details.

13. **Shop (Consumer):** The consumer-facing interface where users browse products.

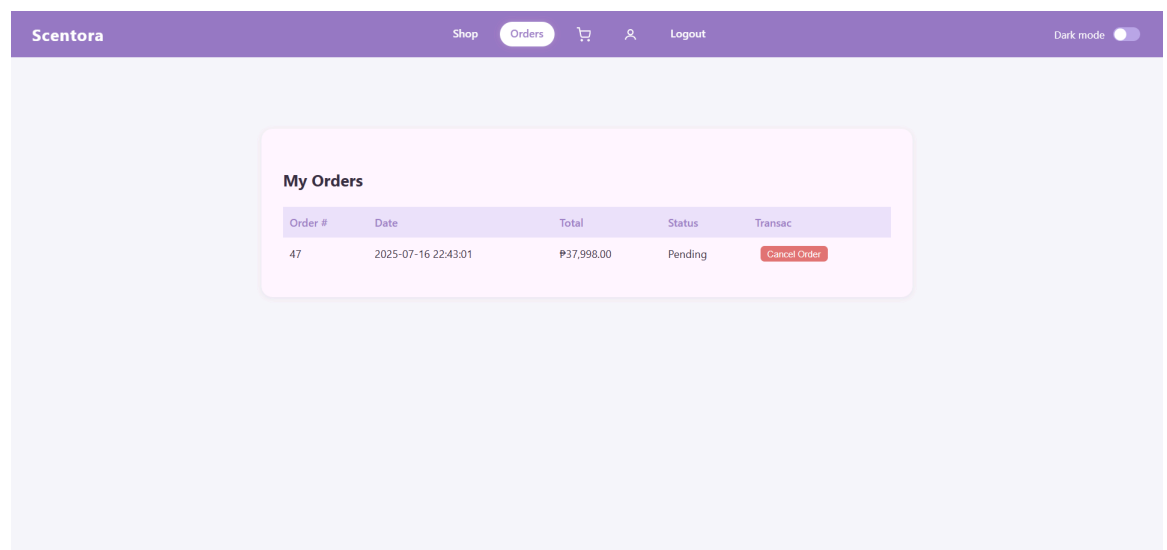

14. **View Detail Page:** Displays detailed information about a selected product.

15. **Add to Cart Page:** Lets users add products to their shopping cart for checkout.

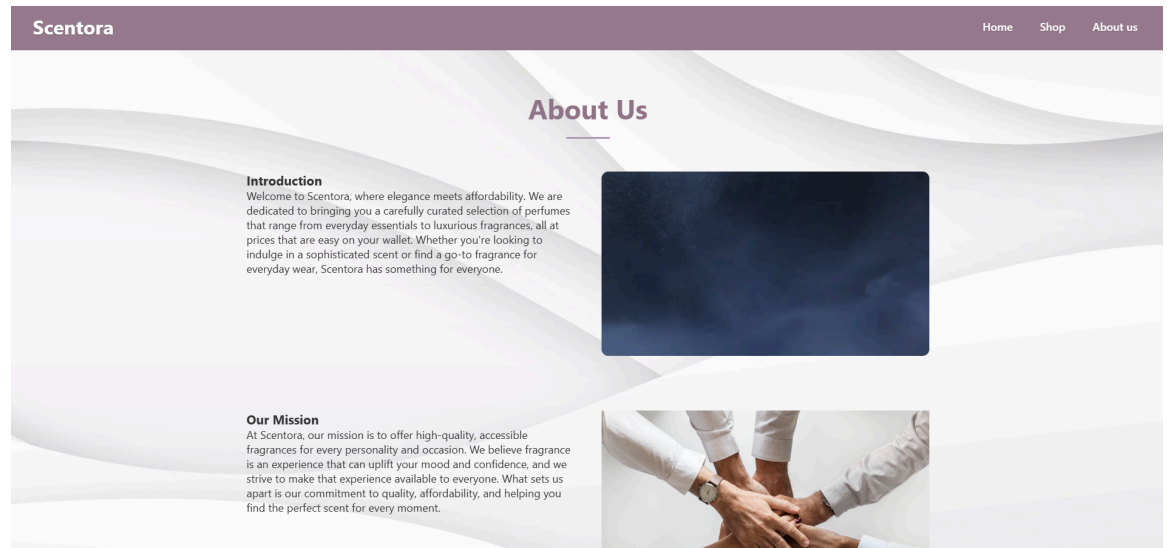

16. **Checkout Page:** Allows users to review their cart and proceed with payment.

17. **User Profile Page:** Displays and allows users to update their personal information.

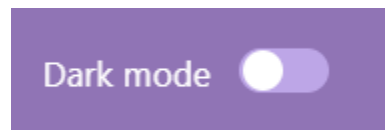

18. **View Order Page:** Lets users view details of their past and current orders.

19. **About Us Page:** Provides information about the company, its mission, vision, and the team behind the platform.

20. **Dark Mode Button:** Enables users to switch between light and dark themes for a personalized visual experience.

APPENDICES

Appendix A

Summary of the Transcript:

The group has decided to pursue the development of an Integrated Inventory and Online Shop System for a local business. One of the group members proposed the idea after observing the challenges faced by small retailers who rely on manual inventory tracking and offline transactions.

During a preliminary consultation with the client, the group asked about the existing workflow of inventory and sales. The client explained that they manually record product stocks in a notebook and compute sales using a calculator. Inventory errors often occur, especially during restocking or busy periods, leading to either overstocking or shortages. Furthermore, customer orders are received through text or social media, making it hard to track order history and customer preferences.

The client expressed the need for a centralized system where they can update product information, track stock levels in real-time, and accept customer orders online. They also wanted features like a checkout summary page, inventory monitoring, and user-friendly access through a browser interface on desktop or mobile.

Following the collection of these details, the team thanked the client for their feedback and pledged to create a system that streamlines daily operations and improves accuracy by integrating a basic e-commerce experience and simplifying inventory management

Appendix B

Interview Questions for Client/Business Owner

Current Business Flow

- a. How do you currently manage your inventory?
- b. What challenges do you face with managing stock and orders manually?

System Features and Expectations:

- c. What key features would you like in the new system? (e.g., order management, inventory tracking)
- d. How would you like the dashboard to appear? (inventory, orders, etc.)?
- e. How do you want to manage product information and stock updates?
- f. Should the system be accessible via desktop and mobile?
